

2-Heteroaryl carboxamides

5 The invention relates to novel 2-heteroaryl carboxamides, processes for their preparation, and their use for producing medicaments for the treatment and/or prophylaxis of diseases and for improving perception, concentration, learning and/or memory.

10 Nicotinic acetylcholine receptors (nAChR) form a large family of ion channels which are activated by the messenger acetylcholine which is produced in the body (Galzi et al., *Neuropharmacol.* 1995, 34, 563-582). A functional nAChR consists of five subunits which may be different (certain combinations of  $\alpha$ 1-9 and  $\beta$ 1-4, $\gamma$ , $\delta$ , $\epsilon$  subunits) or identical ( $\alpha$ 7-9). This leads to the formation of a diversity of subtypes which differ in the distribution in the muscles, the nervous system and other organs

15 (McGehee et al., *Annu. Rev. Physiol.* 1995, 57, 521-546). Activation of nAChR leads to influx of cations into the cell and to stimulation of nerve cells or muscle cells. Selective activation of individual nAChR subtypes restricts this stimulation to the cell types which have a corresponding subtype and is thus able to avoid unwanted side effects such as, for example, stimulation of nAChR in the muscles. Clinical

20 experiments with nicotine and experiments in various animal models indicate that central nicotinic acetylcholine receptors are involved in learning and memory processes (e.g. Rezvani et al., *Biol. Psychiatry* 2001, 49, 258-267). Nicotinic acetylcholine receptors of the  $\alpha$ 7 subtype ( $\alpha$ 7 nAChR) have a particularly high concentration in regions of the brain which are important for learning and memory,

25 such as the hippocampus and the cerebral cortex (Séguéla et al., *J. Neurosci.* 1993, 13, 596-604). The  $\alpha$ 7 nAChR has a particularly high permeability for calcium ions, increases glutamatergic neurotransmission, influences the growth of axons and, in this way, modulates neuronal plasticity (Broide et al., *Mol. Neurobiol.* 1999, 20, 1-16).

Certain *N*-(1-azabicyclo[2.2.2]oct-3-yl)heteroaryl carboxamides for the treatment of, inter alia, psychoses are described in DE-A 37 24 059.

5 *N*-(Azabicycloalkyl)heteroaryl carboxamides, in particular *N*-(1-azabicyclo[2.2.2]oct-4-yl)benzothiophene-3-carboxamides, are disclosed in WO 93/15073 and in EP-A 485 962 as intermediates for the synthesis of pharmaceutically active compounds.

10 US 4,605,652 and EP-A 372 335 disclose, for example, *N*-(1-azabicyclo[2.2.2]oct-3-yl)thiophene-2-carboxamide and its memory-improving effect.

JP-A 14 030 084 describes 1-azabicycloalkanes for the treatment of, inter alia, dementia, attention deficit hyperactivity disorder and impairments of learning and memory.

15 WO 02/44176, WO 02/085901, WO 01/60821, EP-A 1 231 212 and EP-A 1 219 622 disclose further  $\alpha 7$  nicotinic acetylcholine receptor agonists for the treatment of central nervous system diseases.

10 takes place with water.

and where appropriate

[A] the resulting compounds (I) are alkylated on the quinuclidine nitrogen atom using appropriate alkylating reagents, or

[B] the resulting compounds (I) are oxidized on the quinuclidine nitrogen atom using suitable oxidizing agents,

and the resulting compounds (I) are converted into their solvates, salts or solvates of the salts where appropriate with the appropriate (i) solvents and/or (ii) bases or acids.

Reaction of the compounds (II) and (III) generally takes place in an inert solvent in the presence of a transition metal catalyst, in the presence of a base and, where appropriate, in the presence of copper(I) iodide.

The process of the invention is preferably carried out in a temperature range from 70°C to 110°C under atmospheric pressure.

Examples of inert solvents are ethers such as dioxane, tetrahydrofuran or 1,2-dimethoxyethane, hydrocarbons such as benzene, xylene or toluene, nitroaromatic compounds such as nitrobenzene, where appropriate *N*-alkylated carboxamides such as dimethylformamide, dimethylacetamide, alkyl sulphoxides such as dimethyl sulphoxide or cyclic lactams such as *N*-methylpyrrolidone. Stille, *Angew. Chem.* 1986, 98, 504 and with substituted amines: cf. S. L. Buchwald et al., *J. Organomet. Chem.* 1999, 576, 125ff. (see also J. Tsuji, *Palladium Reagents and Catalysts*, Wiley, New York, 1995).

The corresponding pyrido derivatives can be synthesized starting from 2-halobenzonitriles by reaction with methyl mercaptoacetate to give the 3-amino-benzothiophene-2-carboxylic esters:

## Synthesis scheme 2:

- 5 The nitrogen atom shown in the ring may replace a CH group at one of positions 1 to 4 in the aromatic system.

The amino function can be removed by diazotization. Finally, the ester can be hydrolysed to give the target compound.

10

Substituted benzofuran-2-carboxylic acids can be obtained for example as described by D. Bogdal et al., *Tetrahedron* 2000, 56, 8769.

The compounds of the invention are suitable for use as medicaments for the treatment and/or prophylaxis of diseases in humans and animals.

They act as  $\alpha 7$  nAChR agonists and show a valuable range of pharmacological effects which could not have been predicted.

20

The compounds of the invention can, because of their pharmacological properties, be employed alone or in combination with other active ingredients for the treatment and/or prevention of cognitive impairments, especially of Alzheimer's disease.

- Because of their selective effect as  $\alpha 7$  nAChR agonists, they are particularly suitable for improving perception, concentration, learning or memory, especially after cognitive impairments like those occurring for example in mild cognitive impairment, age-associated learning and memory impairments, age-associated memory loss, vascular dementia, craniocerebral trauma, stroke, dementia occurring after strokes (post-stroke dementia), post-traumatic brain syndrome, general concentration impairments, concentration impairments in children with learning and memory problems, attention deficit hyperactivity disorder, Alzheimer's disease, Lewy body dementia, dementia with degeneration of the frontal lobes, including Pick's syndrome, Parkinson's disease, progressive nuclear palsy, dementia with corticobasal degeneration, amyotrophic lateral sclerosis (ALS), Huntington's disease, multiple sclerosis, thalamic degeneration, Creutzfeld-Jakob dementia, HIV dementia, schizophrenia, schizophrenia with dementia or Korsakoff's psychosis.
- 15 The compounds of the invention can be employed alone or in combination with other active ingredients for the prophylaxis and treatment of acute and/or chronic pain (for a classification, see "Classification of Chronic Pain, Descriptions of Chronic Pain Syndromes and Definitions of Pain Terms", 2nd edition, Meskey and Begduk, editors; IASP Press, Seattle, 1994), especially for the treatment of cancer-induced pain and chronic neuropathic pain like, for example, that associated with diabetic neuropathy, postherpetic neuralgia, peripheral nerve damage, central pain (for example as a consequence of cerebral ischaemia) and trigeminal neuralgia, and other chronic pain such as, for example, lumbago, backache (low back pain) or rheumatic pain. In addition, these active ingredients are also suitable for the therapy of primary acute pain of any origin and of secondary states of pain resulting therefrom, and for the therapy of states of pain which were formerly acute and have become chronic.
- 25 The compounds of the invention can be employed alone or in combination with other active ingredients for the treatment of schizophrenia.

The *in vitro* effect of the compounds of the invention can be shown in the following assays:

1. **Determination of the affinity of test substances for  $\alpha 7$  nAChR by inhibition of [ $^3$ H]-methyllycaconitine binding to rat brain membranes**

The [ $^3$ H]-methyllycaconitine binding assay is a modification of the method described by Davies et al. in *Neuropharmacol.* 1999, 38, 679-690.

Rat brain tissue (hippocampus or whole brain) is homogenized in homogenization buffer (10% w/v, 0.32 M sucrose, 1 mM EDTA, 0.1 mM phenylmethylsulphonyl fluoride (PMSF), 0.01% (w/v)  $\text{NaN}_3$ , pH 7.4, 4°C) at 600 rpm in a glass homogenizer. The homogenate is centrifuged (1000 x g, 4°C, 10 min) and the supernatant is removed. The pellet is resuspended (20% w/v) and the suspension is centrifuged (1000 x g, 4°C, 10 min). The two supernatants are combined and centrifuged (15 000 x g, 4°C, 30 min). The pellet obtained in this way is referred to as the P2 fraction.

The P2 pellet is suspended in binding buffer (50 mM Tris-HCl, 1 mM  $\text{MgCl}_2$ , 120 mM NaCl, 5 mM KCl, 2 mM  $\text{CaCl}_2$ , pH 7.4), and the suspension is centrifuged (15 000 x g, 4°C, 30 min), twice.

The residue is resuspended in binding buffer and incubated in a volume of 250  $\mu\text{l}$  (amount of membrane protein 0.1 - 0.5 mg) in the presence of 1-5 nM [ $^3$ H]-methyllycaconitine 0.1% (w/v) BSA (bovine serum albumin) and various concentrations of the test substance at 21°C for 2.5 h. Incubation is then carried out in the presence of 1  $\mu\text{M}$   $\alpha$ -bungarotoxin or 100  $\mu\text{M}$  nicotine or 10  $\mu\text{M}$  MLA (methyllycaconitine).

The incubation is stopped by adding 4 ml PBS (20 mM  $\text{Na}_2\text{HPO}_4$ , 5 mM  $\text{KH}_2\text{PO}_4$ , 150 mM NaCl, pH 7.4, 4°C) and filtering through type A/E glass fibre filters (Gelman Sciences) which have previously been placed in 0.3% (v/v)

polyethyleneimine (PEI) for 3 h. The filters are washed twice with 4 ml of PBS (4°C), and the bound radioactivity is determined by scintillation measurement. All the assays are carried out in triplicate. The dissociation constant  $K_i$  of the test substance was determined from the  $IC_{50}$  of the compounds (concentration of the test substance at which 50% of the ligand bound to the receptor is displaced), the dissociation constant  $K_D$  and the concentration  $L$  of [ $^3H$ ]-methyllycaconitine using the equation  $K_i = IC_{50} / (1 + L/K_D)$ .

In place of [ $^3H$ ]-methyllycaconitine it is also possible to employ other  $\alpha 7$  nAChR-selective radioligands such as, for example, [ $^{125}I$ ]- $\alpha$ -bungarotoxin or nonselective nAChR radioligands together with inhibitors of other nAChRs.

The suitability of the compounds of the invention for the treatment of cognitive impairments can be shown in the following animal models:

5      2.      **Object recognition test**

The object recognition test is a memory test. It measures the ability of rats (and mice) to distinguish between familiar and unfamiliar objects.

10      The test is described by Blokland et al., *NeuroReport* 1998, 9, 4205-4208; A. Ennaceur et al., *Behav. Brain Res.* 1988, 31, 47-59; A. Ennaceur et al., *Psychopharmacology* 1992, 109, 321-330; and Prickaerts et al., *Eur. J. Pharmacol.* 1997, 337, 125-136.

15      In a first run, a rat is confronted in an otherwise empty observation arena of relatively large size by two identical objects. The rat will investigate, i.e. sniff round and touch, both objects extensively. In a second run, after an interval of 24 hours, the rat is put in the observation arena again. One of the familiar objects has now been replaced by a new, unfamiliar object. If a rat recognizes the familiar object, it will concentrate on  
20      investigating the unfamiliar object. However, after 24 hours, a rat has normally forgotten which object it investigated in the first run, and it will therefore inspect

both objects to the same extent. Administration of a substance with a learning- and memory-improving effect may lead to a rat recognizing the object seen in the first run 24 hours previously as familiar. It will investigate the new, unfamiliar object in more detail than the familiar one. This memory ability is expressed in a discrimination index. A discrimination index of zero means that the rat investigates both objects, the old and the new, for equal times; that is to say it has not recognized the old object and reacts to both objects as if they were new. A discrimination index greater than zero means that the rat inspects the new object longer than the old one; that is to say the rat has recognized the old object.

### 3. Social recognition test:

The social recognition test is a test to examine the learning- or memory-improving effect of test substances.

Adult rats housed in groups are placed singly in test cages 30 minutes before the start of the test. Four minutes before the start of the test, the test animal is put in an observation box. After this adaptation time, a juvenile animal is put in with the test animal and the time for which the adult animal investigates the juvenile animal is measured for 2 minutes (trial 1). All behaviours clearly directed at the young animal are measured, i.e. anogenital inspection, pursuit and fur care, during which the old animal is no further than 1 cm from the young animal. The juvenile animal is then taken out, and the adult is left in its test cage (for 24-hour retention, the animal is returned to its home cage). The adult test animal is treated with test substance before or after the first test. Depending on the timing of the treatment, the learning or the storage of the information about the young animal can be influenced by the substance. After a fixed period (retention), the test is repeated (trial 2). A larger difference between the investigation times measured in trials 1 and 2 means that the adult animal has remembered the young animal better.

The compounds of the invention are suitable for use as medicaments for humans and animals.

5 The present invention also includes pharmaceutical preparations which, besides inert, nontoxic, pharmaceutically suitable excipients and carriers, contain one or more compounds of the invention, or which consist of one or more compounds of the invention, and to processes for producing these preparations.

10 The compounds of the invention are to be present in these preparations in a concentration of from 0.1 to 99.5% by weight, preferably from 0.5 to 95% by weight, of the complete mixture.

Besides the compounds of the invention, the pharmaceutical preparations may also contain other active pharmaceutical ingredients.

15 The abovementioned pharmaceutical preparations can be produced by known methods in a conventional way.

20 The novel active ingredients can be converted in a known manner into conventional formulations such as tablets, coated tablets, pills, granules, aerosols, syrups, emulsions, suspensions and solutions, using inert, nontoxic, pharmaceutically suitable excipients or solvents. In these cases, the therapeutically active compound should in each case be present in a concentration of about 0.5 to 90% by weight of the formulation, i.e. in amounts which are sufficient to reach the stated dose range.

25 The formulations are produced for example by extending the active ingredients with solvents and/or excipients, where appropriate with use of emulsifiers and/or dispersants, it being possible for example when water is used as diluent where appropriate to use organic solvents as auxiliary solvents.

30

Administration can take place in a conventional way, preferably orally, transdermally or parenterally, especially perlingually or intravenously. However, it can also take place by inhalation through the mouth or nose, for example with the aid of a spray, or topically via the skin.

5

It has generally proved advantageous to administer amounts of about 0.001 to 10 mg/kg, on oral administration preferably about 0.005 to 3 mg/kg, of body weight to achieve effective results.

10

It may, nevertheless, be necessary where appropriate to deviate from the stated amounts, in particular as a function of the body weight or of the mode of administration, of the individual behaviour towards the medicament, the nature of its formulation and the time or interval over which administration takes place. Thus, it may be sufficient in some cases to make do with less than the aforementioned minimum amount, whereas in other cases the stated upper limit must be exceeded. Where larger amounts are administered, it may be advisable to divide these into a plurality of single doses over the day.

15

20

Unless indicated otherwise, all quantitative data relate to percentages by weight. Solvent ratios, dilution ratios and concentration data of liquid/liquid solutions are based in each case on volume. The statement "w/v" means "weight/volume". Thus, for example, "10% w/v" means: 100 ml of solution or suspension contain 10 g of substance.

Starting compounds:General method ASynthesis of methyl 1-benzothiophene-2-carboxylates:

10 Under an argon atmosphere, 1.5 equivalents of sodium hydride (60% in liquid paraffin) are introduced into absolute DMSO (0.60-1.26 M suspension). At room temperature, 1.1 equivalents of methyl mercaptoacetate are slowly added dropwise to the reaction mixture, and it is left to stir at room temperature until evolution of hydrogen ceases (about 15 min). 1.0 equivalent of the appropriate benzaldehyde are dissolved in absolute DMSO (1.60-3.36 M solution) and added at room temperature to the reaction mixture. The reaction mixture is stirred until the reaction is complete (about 5-10 min) and then poured into ice-water. The resulting precipitate is filtered off with suction, dried at 40°C in vacuo overnight and reacted further as crude product.

General method BSynthesis of 1-benzothiophene-2-carboxylic acids:

25 A mixture of equal parts of THF and 2 N aqueous potassium hydroxide solution (0.28-0.47 M solution) is added to the appropriate methyl 1-benzothiophene-2-carboxylate. The reaction mixture is left to stir at room temperature overnight. The

THF is removed in vacuo, and the aqueous reaction mixture is acidified with concentrated hydrochloric acid. The resulting precipitate is filtered off with suction and dried in vacuo at 40°C.

5     General method C

Amide linkage between 3-quinuclidinamine and 2-benzothiophene- or 2-benzofurancarboxylic acids:

10     1.0 eq. of the appropriate enantiomeric 3-quinuclidinamine hydrochloride is introduced together with 1 eq. of the carboxylic acid and 1.2 eq. of HATU into DMF at 0°C. After addition of 1.2 eq. of *N,N*-diisopropylethylamine, the mixture is stirred at RT. After 30 min., a further 2.4 eq. of *N,N*-diisopropylethylamine are added and the mixture is stirred at RT overnight.

2.51 g (13.1 mmol) of EDC, 1.77 g (13.1 mmol) of HOBt and 5.47 ml (39.2 mmol) of triethylamine are added to a solution of 2.92 g (10.9 mmol) of 7-(2-methoxyphenyl)-1-benzofuran-2-carboxylic acid (Example 21A) and 2.17 g (10.9 mmol) of (R)-3-aminoquinuclidine dihydrochloride in 35 ml of DMF at 0°C. After stirring at room temperature for 18 hours, a further 434 mg (2.2 mmol) of (R)-3-aminoquinuclidine dihydrochloride and 418 mg (2.2 mmol) of EDC are added. After 2 h at 55°C, the reaction solution is concentrated and the residue is partitioned between 200 ml each of ethyl acetate and 2N sodium hydroxide solution. The organic phase is washed 15 times with 100 ml of 2N sodium hydroxide solution each time. The combined aqueous phases are back-extracted with 250 ml of ethyl acetate. The combined organic phases are dried over sodium sulphate and concentrated and, after addition of a 5:1 mixture of methanol and 1N hydrochloric acid to the residue, again concentrated and dried under high vacuum. Recrystallization of the residue from 10 ml of a 10:1 mixture of isopropanol and ethanol results in 2.73 g (60.5% of theory) of the title compound.
